AMENDMENTS TO THE CLAIMS

1. (Currently amended) A delay time adjusting method of adjusting a delay

time of an input signal so that a phase of said input signal and a phase of an output

signal match each other, the method comprising the steps of:

comparing phases of said output signal and said input signal with each

other; and

starting an increase of the delay time whenever a phase difference is

detected in the step of comparing increasing the delay time when a phase difference

detected in the step of comparing indicates that said output signal is ahead of or behind

the input signal.

2. (Original) The delay time adjusting method as claimed in claim 1, further

comprising a step of producing said output signal by delaying said input signal by a DLL

circuit.

3. (Previously Presented) A delay time adjusting method comprising:

comparing the phases of an input first periodic signal and an output

second periodic signal;

adjusting a delay time of the input first periodic signal so that a phase of

the input first periodic signal and a phase of the output second periodic signal match

within a predetermined tolerance, wherein

when a phase of a predetermined rising edge of said output second

periodic signal is behind a phase of a predetermined rising edge of said input first

Attorney Docket No.: 100353-00039

periodic signal, said delay time is adjusted so that said predetermined rising edge of

said output second periodic signal matches a rising edge of said input first periodic

signal, a phase of the rising edge being behind and nearest to said phase of said

predetermined rising edge of said output second periodic signal, and wherein the

adjusting of said delay at an initial stage of the adjusting is to increase said delay when

starting the step of adjusting of said delay.

4. (Previously Presented) A delay time adjusting method of adjusting a delay

time of an input first periodic signal so that a phase of said input first periodic signal and

a phase of an output second periodic signal match each other based on a comparison

between phases of said input first periodic signal and said input second periodic signal,

the method comprising:

a first step of judging whether a phase of a predetermined rising edge of

said output second periodic signal is behind a phase of a first rising edge of said input

first periodic signal; and

a second step of increasing the delay time to adjust said phase of said

output second periodic signal so that, when said phase of said predetermined rising

edge is judged to be behind said phase of said first rising edge in said first step, said

phase of said predetermined rising edge and a phase of a second rising edge of said

input first periodic signal match each other, the second rising edge being one period

behind said first rising edge, wherein the step of delaying at an initial stage of

adjustment is to increase the delay time when starting the delay time adjustment.

TECH/301025.1

5. (Previously presented) A delay time adjusting circuit for adjusting a delay

time of an input signal so that a phase of said input signal and a phase of an output

signal match each other between phases based on a comparison of said input signal

and said output signal, the circuit comprising:

a detecting circuit for detecting a phase difference between said phase of

said input signal and said phase of said output signal; and

a delaying circuit for increasing a delay time of said phase of said output

signal, when starting the delay time adjustment, so that the delay time is set to a value

at which said phase difference becomes N periods, where N is an integer other than

zero.

6. (Previously presented) A delay time adjusting circuit for adjusting a delay

time of an input first periodic signal so that a phase of said input first periodic signal and

a phase of an output second periodic signal match each other based on a comparison

between phases of said input first periodic signal and said input second periodic signal,

the circuit comprising:

a judging circuit for judging whether a phase of a predetermined rising

edge of said output second periodic signal is behind a phase of a predetermined rising

edge of said input first periodic signal; and

a delaying circuit for adjusting said delay time so that, when said phase of

said predetermined rising edge of said output second periodic signal is judged to be

behind said phase of said predetermined rising edge of said input first periodic signal by

said judging circuit, said predetermined rising edge of said output second periodic signal

Application No.: 09/777,897

Attorney Docket No.: 100353-00039

TECH/301025.1

matches a rising edge of said input first periodic signal, a phase of the rising edge being

behind and nearest to said phase of said predetermined rising edge of said output

second periodic signal, wherein the step of delaying at an initial stage of adjustment is

to increase the delay time when starting the delay time adjustment.

7. (Previously presented) A delay time adjusting circuit for adjusting a delay

time of an input first periodic signal so that a phase of said input first periodic signal and

a phase of an output second periodic signal match each other based on a comparison

between phases of said input first periodic signal and said input second periodic signal,

the circuit comprising:

a delaying circuit for delaying said input first periodic signal so as to

generate said output second periodic signal;

a phase-detecting circuit for detecting whether a phase of a predetermined

rising edge of said output second periodic signal is behind a phase of a first rising edge

of said input first periodic signal; and

an adjusting circuit for controlling said delaying circuit so that, when said

phase of said predetermined rising edge is judged to be behind said phase of said first

rising edge by said phase-detecting circuit, said delaying circuit delays said phase of

said output second periodic signal until said phase of said predetermined rising edge

and a phase of a second rising edge of said input first periodic signal match each other,

the second rising edge being one period behind said first rising edge, wherein the step

of delaying at an initial stage of adjustment is to increase the delay time when starting

the delay time adjustment.

5

Application No.: 09/777,897 Attorney Docket No.: 100353-00039

TECH/301025.1

8. (Previously presented) The delay time adjusting circuit as claimed in claim 7, wherein said adjusting circuit controls said delaying circuit so that, after said phase of said predetermined rising edge and said phase of said second rising edge match each other, said phase of said predetermined rising edge and said phase of said second rising edge match each other all the time within a tolerable range.
